mingodad wrote on Tue, 15 April 2014 11:40Isn't worth to use something like Lua for witz, it already has all error handling well done and has more capabilities out of box.

I'm not saying to move business logic to templates, but having flexibility to try new things/variations without need to recompile is an interesting feature.

Cheers !

I guess that is quite tough design decision in all template systems.

Before creating witz I was, of course, investigating other templating systems, then defined witz in a way that about permits as much as them.

I would say that if templates are common practice with PHP framework, then perhaps putting more flexibility into templates is a bad idea (because pure PHP can be considered a templating system with ultimate flexibility :).
