Also, with watchdog you could test every revision. If you're afraid about abusing too much server CPU, it can run distributed. I think there is many people who would contribute part of their hardware :) I'd certainly be first one to do so :)

I does not run on website CPU, it runs on nightly build machine... (at my home).

Anyway, single run is about 3 hours, so it is unlikely to be possible to test each revision.

Mirek
