Also, with watchdog you could test every revision. If you're afraid about abusing too much server CPU, it can run distributed. I think there is many people who would contribute part of their hardware :) I'd certainly be first one to do so :)

I does not run on website CPU, it runs on nightly build machine... (at my home).

Anyway, single run is about 3 hours, so it is unlikely to be possible to test each revision.

Mirek

Not a problem, with 2 client machines (yours and mine, for example :) ) you could test ~16 revisions a day, which is probably enough. Of course, if you don't want to have your home pc crunching tests all day, you can set it up to only contribute by testing one revision a day. The client is fully in control regarding what and how much is tested. We could discuss this over a beer, if you're interested ;)
