Hello Mirek,

Identifier highlighting is really cool feature, but in current implementation it has some drawbacks. First of all it should also work with selection callback (WhenSel). Example (ide/idewin.cpp - line 309):

editor.WhenSel = THISBACK(SetToolBar); // <- This callback should also operate "Identifier highlighting".

The second issue is that it doesn't work correctly in some cases. Example:

In this example "turn" substring inside "return" shouldn't be highlighted.

Sincerely, Klugier
