Subject: Different file versions among build methods
Posted by crydev on Mon, 23 Jun 2014 15:46:03 GMT

Hello,

I was wondering: Is it possible to set a different file to compile into the output for different architectures? For example, in Visual Studio, you have configurations. You can select a different resources file or exports.def file (for linker input, exported functions e.g.) for each configuration. I would love to use a different resource.rc file among my build methods.

Thanks in advance!
