yrnkrn wrote on Sun, 21 September 2014 07:09Hi,

I am trying to use uld.exe as a faster linker for MingW-w64 4.9.1, dwarf exceptions, 32 bit. I built the latest release, 1.2.21 and tried to link a simple hello\_world.c. First, there was a symbol `__set_invalid_parameter_handler` missing which I faked with:

```
void __set_invalid_parameter_handler() { }
```

Then, the program linked ok (and very fast), but the resulting exe did nothing. Loading under gdb it crashed.

How to make uld work?

Yaron

I am sorry, but uld is not maintained any more. MINGW linker got faster a couple of years ago and, more importantly, Windows SDK with C++ compiler included became free. I forgot to remove it from 'canonical' 'uppsrc', but it is moved now.

Of course, would you like to work on uld, you are welcome, it is open-source after all :)

Mirek
