Subject: A Very Strange Issue

I have been experiencing a very strange error when working on some code... Every time I compile, I get this error. The particularly strange part is that without updating or editing the U++ header files, this error appeared. The previous evening, my compiles had not been failing. Anyone have a clue why this might be?

/home/CENSORED/upp/uppsrc/Core/Defs.h:424:8: error: expected unqualified-id before string constant
 extern "C" byte *i; \
        ^

NOTE: The specific code I am working on is both non-trivial and proprietary, so unfortunately while I would love to share it I cannot. I am willing to attempt to make a compilable test program, but I would like to ask before doing that just in case the solution is trivial, obvious, or the cause is already known from previous investigation.

Thanks in advance for your consideration, and the time spent reading this message.
