
Subject: How to call cl.exe using LocalProcess

Hi,

This question is a bit off-topic, but I'm trying to compile a cpp file using LocalProcess.

My program creates a .bat file which when run with double click or a command prompt works fine.

But when invoking the .bat with LocalProcess, I get an error similar to:
c1xx : fatal error C1083: Cannot open source file: 'd:\MyApps\tests\tests.cpp': Permission denied

The reason I'm writing a bat first and executing it was in hopes of getting over this error message when trying to execute the body of the bat directly using LocalProcess.

Since TheIDE builds source code just fine, I was wondering if anybody working on the build code for TheIDE encountered a similar situation?

Thank you!
