rainbowsally wrote on Sat, 20 December 2014 20:30The TopMost(bool) function sets or resets the x11 attribute for a window that can stay on top of all the others.

Here's the fix for the Eye Care example for linux folks.

```
void EyeCare::Sync()
{
#ifdef PLATFORM_WIN32
 ExStyle(config.topmost ? GetExStyle() | WS_EX_TOPMOST
              : GetExStyle() & ~WS_EX_TOPMOST);
  // -rs add these two lines
#else
 config.topmost ? TopMost(true) : TopMost(false);
#endif
 trayicon.Icon(ignore ? EyeCareImg::off() : EyeCareImg::icon());
 if(config.hideicon)
  ignore = false;
 trayicon.Show(!config.hideicon);
 Restart();
}
```

Thanks for reporting. The problem was that by the time that example was created, TopWindow did not have TopMost method yet. Now whole thing was replaced with TopMost(config.topmost).
