Thanks for reporting. The problem was that by the time that example was created, TopWindow did not have TopMost method yet. Now whole thing was replaced with TopMost(config.topmost).

There's a way to set the _NET_STAYS_ON_TOP (or whatever it's called) atom in X without any dependency on Qt or any other toolkit.

I've done it with FLTK 2.0 (a discontinued version). But I don't yet know how to integrate it into U++ yet or if that's even desirable. What we have now works but if we need generic X11 code, I may be able to help. :)
