Subject: LocalProcess trivia bug in Write() function causing incorrect error strings
Posted by hans on Tue, 20 Jan 2015 22:00:13 GMT

Line 518 ff:

```
  for(int wn = 0; ret && wn < s.GetLength(); wn += n) {
   ret = WriteFile(hInputWrite, ~s + wn, s.GetLength(), &n, NULL);
   String ho = wreso;
   String he = wrese;
   wreso = wrese = Null;
   Read2(wreso, wrese);
   wreso = ho + wreso;
   wrese = ho + wrese;
  }
```

obviously last line should be wrese = he + wrese;

Same on line 538.

And I even don't understand why it was coded this way, it seems dangerous to give member variables (wreso, wrese) as parameters to the member function.
But perhaps there is a good reason for :p
