Well that is not really important,so I bypass this for now and start with the second point:
try to compile theIDE under VC2008.

Have you tried 'recommended' path?

http://www.ultimatepp.org/appideinstall$en-us.html

Mirek

Well,
the directory structure of the MSVC compiler and Intel compiler is different from that 'recommended'.
That does not do any problem to che MSVC compiler and I suppose that also che Intel compiler is not
affected by this, becouse there is no error about things not found.
When I try to compile TheIDE the first error is that:

'recommended' is to download Win7 SDK and let TheIDE autosetup everything. See the link above.

We are supporting later SDKs and are able to use compilers provided with Visual Studio, but that is sometimes quirky.
