By the way, one more question:
Can I write config (command-line parameters set) for UMK for compile in situation when path for MyApps every time is different?

(I try to config automatic build farm on Teamcity, but building envirenment every time is path like:
/home/build/agent/2015-01-15/ag0123654/MyApps/
Every time I must recreate MyApps.var with actual path
/home/build/agent/2015-01-15/ag0123654/MyApps/)

There is second form of umk-parameters set, where not need to point of name of Package-Assembly.

May be, you have idea, how to simplest way transform command-line parameters of umk to second form?

How to specify umk to make as Makefile, path-independent (proceeding from the current path).

May be, you have idea, how to simplest way transform commited decision to suggested form ?
