my code depends on upp.

here is part of the failure

```
make[1]: Entering directory `/build/buildd/ezcomm-3.6'
```

```
building...
```

```
umk ${PWD},/usr/share/upp/uppsrc ezcomm GCC -brv +GUI,SHARED,MT ${PWD}/ezcomm
```

```
Inline assembly: /build/buildd/ezcomm-3.6;/usr/share/upp/uppsrc
```

```
Output directory: /home/buildd/.upp/umk/_out
```

```
Main package: /build/buildd/ezcomm-3.6/ezcomm/ezcomm.upp
```

```
Build method:
```

```
Invalid build method
```

```
make[1]: *** [all] Error 3
```

this command line works fine on my local machine.

Is GCC not recognized on launchpad servers?

And by the way, will this output directory not be recognized by launchpad?
