Subject: Makefile's install depends on all

I use command line umk to build.
I wonder from where I got this Makefile.
first I run make, which will build "all".
Then I run make install. It relies on "all". "all" will complain ${program_name} already exists, which IS the former result.
"install" should depends on "all" but use its result if it has been run.

And, I wonder why "install" needs gawk, which is not needed when I compile anything in theide.
