Subject: Makefile's install depends on all

I use command line umk to build.  
I wonder from where I got this Makefile.  
first I run make, which will build "all".  
Then I run make install. It relies on "all". "all" will complain \${program\_name} already exists, which IS the former result.  
"install" should depends on "all" but use its result if it has been run.

And, I wonder why "install" needs gawk, which is not needed when I compile anything in theide.
