
Subject: unhandled exception does not show in the stack

Hi,

I had a crash...stack seemed to be damaged. The debugger did not show a proper stack, just a hexadecimal number.

No function names nothing..

I took me half day to figure out that stack was not damaged.. just there was a unhandled exception.

I started Sysinternals process explorer which showed a readable stack for any thread I looked it. The process explorer can show snapshots of the stack. If the debugger could show the current state of the stack, that would be an improvement.

Is it not a bug in the debugger? if the process explorer can show a correct stack.. Why cannot the debugger?

So it can be a bug.

A.
