Hi Sergey,

You are right. Probably we need more generic Part method with headers defined by a user.
Maybe something like this:

```
HttpRequest& HttpRequest::Part(const Vector<String>& header, const String& data,
                                const char *content_type)
{
    if(IsNull(multipart)) {
        POST();
        multipart = AsString(Uuid::Create());
        if (content_type && *content_type)
            ContentType(String(content_type) + "; boundary=" + multipart);
        else ContentType("multipart/form-data; boundary=" + multipart);
    }
    postdata << "--" << multipart << "\r\n";
    for (int i = 0; i < header.GetCount(); i++){
        postdata << header[i] << "\r\n";
    }

    postdata << "\r\n" << data << "\r\n";
    return *this;
}
```
