Thanks you Mirek,

more investigation, the origine of the 1024 character per line is the AProcess::Read(String&), the internal buffer size of this function is 1024.

then the patch can be reverted, and replaced by this one:

in function
MIValue Gdb_MI2::ReadGdb(bool wait)

replace :

```
dbg->Read(s);  
stringstream ss(s);
```

by

```
String sc;  
do  
{  
s = "";  
dbg->Read(s);  
sc << s;  
}while(s.GetCount());  
  
stringstream ss(sc);
```

call dbg-Read() in a loop in order to read all available data.

I think it is interesting to add a function String AProcess::ReadAllAvailable(), or a global function String ReadAvailable(AProcess&).

this patch resolve the issue described in MIValue Gdb_MI2::MICmd(const char *cmdLine) as a comment:

```
// consume previous output from gdb... don't know why sometimes  
// is there and gives problems to MI interface. We shall maybe  
// parse and store it somewhere  
ReadGdb(false);
```

with this patch, the call to ReadGdb(false) is not needed.
