Hi mtdew3q,

Quote:I am glad I can use synaptic and read it. Umk was going to try to wipe out theIDE. This is because umk is also in the package called theide, you should already have it installed.

Now, to the problem itself. Are you trying to create a U++ package for IBPP? Did you check the Firebird package in bazaar? It might save you some trouble, if you just need this to access firebird...

There are two ways you can use to run custom code from TheIDE. If it is ok to run them manually, you can use macros. If you need it as automatic part of the build process, then there are the custom build steps, You'll probably need to create the shared object in "pre-link" phase.

Best regards,  
Honza
