Hi,

Thankyou for the example:

```
if(p.StartsWith(" "))  
    p.Remove(0);
```

its alot better than mine. :) and my "lpstat -d" outputs kris@woffleys-it:~\$ lpstat -d  
system default destination: RICOH\_Aficio\_MP\_C3000  
kris@woffleys-it:~\$

there's always been a space after the colon, but I cant tell you if its the same across all distributions.

I worked out that, PrinterJob::Execute0 is actually called twice, once with the dialog and then in GetDraw.

```
I changed  
if(dodlg) {  
    dlg.Run();  
    if(!dlg.IsCanceled())  
        return false;  
}
```

to:

```
if(dodlg) { dlg.Run(); }
```

then before the function returns true, i've added:

```
if(dodlg) {  
    if (!dlg.IsCanceled())  
        return false;  
}
```

this allows it to run twice, setting up the options that have caused me so many problems, but also allows the printout to be cancelled. :)
