Well I need to highlight something a bit more complex than C#, so I'm basing my class on CSyntax.

But before I need to update the tabbed code editor because it is not behaving correctly.

How are these controls designed?

Are you supposed to keep track of a list of open files with timestamps and cursor position?

I'm thinking of keeping an Array of CodeEditor instances, one per open file, and hiding the one that are not for the active tab.
