cbpporter wrote on Thu, 02 July 2015 16:20 Another thing I did not manage to figure out: when editing things like .h, pairs of `#ifdef #endif` are joined together by a vertical blue line.

But if I change the extension of the file, the blue line is no longer shown, but the pseudocomment detailing what macro what closed (`// #ifdef foo`) still appears.

What controls the decision to render the blue line or not.

Unfortunately, this part is hardwired into

```
EditorBar::Paint(Draw& w)
```

```
:(
```

(getting CodeEditor ready for client use was not the primary concern when virtualizing highlighting)
