```
void AboutForm::Paint(Draw& w)
```

```
{
    if(m_Tick++ > 10)
    {
        m_Tick = 0;
        m_Water.WarpBlob(rand()%320,rand()%512,rand()%320,rand()%302,m_Water.m_iHpage);
    }
    m_Water.Fdensity = 5;
    m_Water.FbDrawWithLight = FALSE;
    m_Water.FbCalcBigFilter = FALSE;

    /// DWORD m_ImageIn[320*512],m_ImageOut[320*512];
    m_Water.Render(m_ImageIn,m_ImageOut);

    memcpy((void*)m_DestImage.Begin(),(void*)m_ImageOut,320*512*4); /// Direct

    //w.DrawImage(0,0,320,512, m_DestImage);  /// ---- Ceases to work after the first run ???

    w.DrawImage(1,1,320-1,512-1, m_DestImage); /// ---- Working
    SetTimeCallback(10, THISBACK(Render));
}
```

Hard to say without seeing more of code. If m_DestImage is Image, your code is wrong, because you cannot overwrite Begin just as you do. If it is ImageBuffer, it is wrong too, because conversion ImageBuffer -> Image destroys the source.

I can see that you are rendering everything in DWORDS anyway and your problem is just to render it on screen. If that is true, you can bypass Image altogether - there is nice small function called SetSurface

```
void SetSurface(Draw& w, const Rect& dest, const RGBA *pixels, Size srcsz, Point poff)
```

which should exactly solve your problem IMO. Note that SetSurface has "backup path" in case that target Draw does not support it...
