Subject: Printing on raspberry Pi 2

I installed U++ on Raspberry Pi 2 (Debian operating system). Installation was little tricky. Make failed several times. It took whole workday, but by quessing what is missing and then with Apt I managed to install missing packets and U++ finally compiled succesfully.

One critical part in my plan does not yet work. It is printing. Demo addressbook app compiles and works except printing. Preview works and print button opens printer dialog but last phase printing fails.

Have anyone tried same. U++ is new acquaintance to me. I tried some debug what happens after "Perform(report)" but no luck. One remark to case. When printing from separate texteditor printer selection screen is different than in U++ app. My guess is that u++ framework have own printerselection and do not rely operating system default printer selection.
