I want to add a window with more information if the user hover a cell for 1 sec. Like A tool tip, except it will be a window with another ArrayCtrl. The content shown would depend on the row/column being hovered. For that I either need a way to know if the cell is being hovered, or at least if was clicked.

Clicked is easy, either WhenSel or WhenLeftClick.

Extending Tip after 1s is more tricky. I would likely used WhenMouseMove and add timing logic to that.
