Hello,

I will try to merge Ultimate++ with Community version of SqlYog (SQL "database browser").

I have both project code under the same set of header (.h) files running in a Visual Studio 2008 (.sln) environment.

N.B. I see the Ultimate++ code as the 'embrella project' to start the other source code programs like Wget, Tor, NSIS-Installer, ClamAv, etc.

Now I will try to merge the main routines of Ultimate++ and SqlYog.

Greetings Jan Marco
