I am trying to use umk.exe from visual studio to build the upp projects. It does work but needs a clean command. It already has a rebuild command. But the rebuild command rebuild EVERYTHING including uppsrc. So maybe another option to NOT rebuild uppsrc would be useful. (As is deadly slow to do so).

Assuming NOT using blitz.

1. Have an option to clean the object files. if for example you build with -r with a -rc it would clean the release objects except the ones from uppsrc. This would allow to avoid recompile the whole thing when one only wants to recompile ones libraries.
2. Have another option to clean the whole thing including the ones from uppsrc. If for example one uses -rC it would clean all the release objects, including the ones from uppsrc
