I've now tried to use Topic++ to add API documentation, and gave up - it sucks - the concept is brilliant, but the implementation needs serious attention...

Stuff I type in disappear or appear in the wrong place and wrong font.
I tried creating a .tpp file and use that, it got ignored.

unclear/incomplete documentation

In the existing Upp-sources where the stuff is in place, it works well but to get it in place seems much more trouble than just adding inline comments.
