I just discovered UPP while searching for cross platform tools.

Looks great. Downloaded it and built the hello world example on Windows 7 no problems.

Uploaded the 3.2MB release build to www.virustotal.com and 7 of 54 virus scanners returned a trojan result (Gen:Trojan.Heur.TP.jFW@b8Z1enf).

False positives no doubt but why. If I make a win32 hello world it doesn't get false positives.

Are all projects built by UPP going to trigger this kind of result?
