masu wrote on Wed, 16 August 2006 16:05I have my own packages and test packages in a directory not related to all the upp directories, i.e. ~/projects/upp. I added this directory as an assembly to the main package selection dialog. I edit the paths for this assembly concerning upp dirs (package nests, output, common files root) to build against a specific upp version.

Matthias

this was the first reason why I started experimenting with my own ide... That editing is very inconvenient and waste of time... And this way I lose track with other compiled static libs, working apps, data files etc...
