```
struct MyApp : SkylarkApp {  
    // ...  
}
```

It worked, i.e. the html file has been saved, BUT it run a server too that continue to listen. Is there a way to take advantage of Witz template, Renderer class but without running a server?

The server is hidden in SkylarkApp, try not inheriting from it. Not sure how much things will break though :) For start, I'd try to create a simple function from the code you have in the constructor and simply call it from main.
