Hi,
I use sqlite . I tried to use two sqls. one to read a table.. another sql to write another table.
I use fetch to get rows one by one for sql1.

However, fetch keeps resetting or losing its position as I used the second sql
(for second sql I try to create it from another session , that did help..)

How do you do this without fetch? Or how can I use two independent sql so they can fetch independently and not avoid influencing each other.

a.
