Since yours is a main package, when creating the empty project, please choose basic CtrlLib as project type so that CtrlLib and related packages will be automatically added to the Control program.

Or there is an alternative way, which probably is easier in your current situation. Open your current Control project, remove its existing files (from the file listing without actually deleting them), and then right click the file listing region and select "Insert package directory/file(s)" to add the renamed *.h and *.cpp, *.lay, etc files. After that, select Control.h and Control.cpp, make sure they are not empty but with your original NefbG2.h NefbG2.cpp content.
