Weird. That is the place it was always crashing, before I have fixed it with 'finetuning' -O options.

Are you using "Instant setup" default options?

Mirek

No, I was using old -O3 and -Os options.
Replacing -Os with -O2 fixed crashes with Optimal and Size configuration.
I didn't change -O3 to -O2 for the Speed configuration.
I do not understand where you are taking options for the Optimal configuration from. They are not
declared explicitly anywhere.
Another interesting thing. A quote from documentation: "-Os: optimizes code for size. It activates
all -O2 options that do not increase the size of the generated code. It can be useful for machines
that have extremely limited disk storage space and/or CPUs with small cache sizes."
So, basically, -Os is -O2 with some limitations.

Thanks.
