Hi Zbych, many thanks for your post.

Can you provide a very simple sample of your integration of GUI app with Skylark?

About using Websocket: My solution for implement a network remote control was use a separate web server for static files, and use a websocket sever inside the GUI app for receive the commands from clients. Now i want to replace the external webserver by an Skylark instance inside the GUI app, but i need help to do that.

Can you provide a very simple sample of your code to achieve that?

Many thaks in advance.

PS: I have issues with the websocket server because i don't know how to terminate his thread when GUI app is finished. The app is indeed terminated, but with an horrible last window message "Heap leaks detected" (generated by MSVC compiler in debug mode), and of course that have leaks, because the main thread is finished, but not the websocket one.
