This code crash, for ex, on "Used packages->Core->Documents->Standard Ultimate++ packages". Perhaps 'parti' should be increased after 'Advance()'.

The following code works correctly:

```
void RichTxt::GatherValPos(Vector<RichValPos>& f, RichContext rc, int pos, int type) const
{
    int parti = 0;
    while(parti < part.GetCount()-1) { <-----
        RichContext begin;
        Advance(parti++, rc, begin);
        if(part[parti].Is<RichTable>())
            GetTable(parti).GatherValPos(f, begin, pos, type);
        else {
            int nbefore = 0;
            int nline = 0;
            const Para& p = part[parti].Get<Para>();
            if(p.haspos)
                if(type == LABELS)
                    Get(parti, *begin.styles, true).GatherLabels(f, begin.page, begin.py, pos);
                else
                    Get(parti, *begin.styles, true).GatherIndexes(f, begin.page, begin.py, pos);
            }
            pos += GetPartLength(parti) + 1;
        }
}
```
