Theoretically even if you use just GCC you would have to include a big part of those ~30 page

What?

Licenses are way to complicated!

Since when does the compiler you choose have to do anything with the license of software you use? The tool versus the object of the license?

For convenience I am also packaging TDM in a ZIP, as U++ does, so you don't have to go to the TDM site, use that installer, wait for the download and so on. Does this have license implications?

How about Clang? MSC? Clang on Linux? GCC on Linux?
