---

Two new classes have been added to Functions4U:

- LocalProcess2

LocalProcess2 is a fork of LocalProcess adding some new abilities for Windows like:

- Process pause (suspends) and resume including all children processes and threads.
- Process killing includes all children processes and threads.
- Process starting includes default directory.

RealTimeStop

RealTimeStop class is a timer class that can be paused and set back.

In addition it monitors itself so in case that the main program is paused by other process or because the computer is suspended during minutes or hours, it readjust itself to manage just real running time and not clock time.
