I simply copy all of the Core files, and add into vs project,
i am using Core/SSL but the url is not https.

There also a problem in the IDE, only in DEBUG mode it shows

error C2208: "boost::asio::detail::winsock_init<2,0>" no members defined using this type.

that's why i choose Visual Studio at the beginning.

I think some header files conflict with boost::asio in The IDE, but i don't know how to solve it.
