Hi,

I have a data table which would fit in a matrix of $20 * 100.000$ cells, of approx 50MB size. This seems to be too big to be directly stored in the ArrayCtrl, especially if multiple ArrayCtrls could be opened for the same data table. It would be good to just tell the ArrayCtrl the dimensions of the matrix, and a location of a callback function where the cell data could be accessed on demand. Is this already provided? If not, what would be the simplest way to implement it from client code?

thanks,

Sandor
