Hi amrein,

I have tried this with -tb switch but got errors on Centos 7 64bits, as mentioned here:

 http://www.ultimatepp.org/forums/index.php?t=msg&th=9817 &goto=47168&#msg_47168

The upp.spec file you have used has a wrong command in the first line. This may have continued to be in there since a few years.

To extend this I have also tried to use -jn method with make. There is no change.

Regardless of all this, all I want is to compile from reference SocketServer.cpp. As I have misunderstood many things and am a new comer, do I really need to do all this compiling and build the binaries before hand?

I could not even build the SocketServer.cpp and did not know how to build that. As this is not in docs, I need to discover from someone, or continue experimenting.

Could you make a quick suggestion for this?
