Hi amrein,

Thanks for confirming the problem I have identified.

But that relates to only rpmbuild if one wants to build the theIDE.

My question to you was building one cpp from example or reference as a console application.

In my above post, I used - as mentioned - SocketServer.cpp.

May I ask you again to tell me steps or commands to build SocketServer.cpp with GCC?

This should not be difficult for people like you to answer.

Moreover, I see that this community is just so tiny and less co-operative that makes me rethink if I should continue spending my time to learn and get into a forked environment of U++.

If the docs are not there or badly written, then a new comer is immediately exposed to mercy of the community. And if the community is tiny, it just does not work anymore.

Thanks
