- Work on CROSS PLATFORM CONCEPT FIRST. By making compatible on every platform, provide a much better installer for other platforms, like Centos, Fedora and assure that users could very easily install, compile and re-use examples.

What do you mean by 'every platform'?

There are thousands of distros, with small differences in packaging everywhere.

I believe that the original status where we provide compilable tarball was OK. It should not be our 'release' responsibility to provide binary packages for 'every platform' for the release.

I guess that if you would have originally downloaded nightly tarball, ignored .spec file, just did make and fixed dependencies (install missing packages), your experience would have been much better.

Mirek
