After learning Fotran/Cobol on a 5 1/2 megabytes disk, I have seen number of developers today as well as the world of computers and internet growing! Amongst others, I have also seen young and intelligent developers as well as very adamant, conservative and narrow-minded developers.

Just for the record, Fotan/Cobol with 5 1/2 megabytes of disk, you must be younger than me with much more comfortable beginnings. I was learning on Z80 with 48KB of RAM, tape recorder and selfwritten assembler...

FPM does once exactly what you do many times on many platform.

Great. Anybody to do this for U++?
