Thanks.

I believe this is the font problem. We are using Arial for that filelist.

This is a little bit difficult to solve, so please help. In order to have some minimal font support in apps, U++ defines 3 "fundamental" scalable fonts: sans-serif ("Arial"), serif ("Roman") and monospace ("Courier").

These fonts in Windows envinronment are mapped to Arial, Times New Roman and Courier.

BTW, similar scheme is used in HTML protocol.

Now it seems like we should use different fonts for chinesse environment, as Arial obviously lacks chinesse glyphs.

So comes the question: How these settings look like in your web browser? E.g. in firefox, in Tools/Options/Content/Advanced?
