Thanks for the thorough responses!

I think I missed the compiler options, since they are in a tabular format, with "When" as the first column.

Can someone give me an example of what I would enter for "When"?

Let's say I want to add a library named "libutil.a".
What would I add for "When" and "Additional libraries"?
(? -lutil)

I tried adding "-lutil" and expected an error since this library does not exist, but I didn't get an error.

Are there examples in any documentation?

Thanks,
Chris
