Can someone give me an example of what I would enter for "When"?

Let's say I want to add a library named "libutil.a".
What would I add for "When" and "Additional libraries"?
(? -lutil)

Well, "when" makes project compile with different platform / compiler.

E.g. in you case:

When: "GCC LINUX"
Additional library: "util"

Actually, for library, you can use "libutil.a" as well - GCC builder undestands both
