My point of sale software Kassa uses a second monitor to display a client receipt screen. I am using two main screens for that. The client screen is full screen.  
(linux Mint 17.3 64 bit KDE flavour)

```
void DoMain()
{
    KassaAppWindow app(&session);
    One<KassaClientScreen> clientscreen;
#ifdef PLATFORM_LINUX
    app.OpenMain();
#endif
    if (KassaSettings::UseClientScreen())
    {
        clientscreen.Create();
#ifdef PLATFORM_LINUX
        clientscreen->OpenMain();
#endif
    }
    Ctrl::EventLoop();
}
```

The above works both on Linux and Windows, however on Linux the client screen also shows on the task bar. That creates confusion and not useful for a full screen display. Is there a way to not show it on the task bar? Note that on Linux I need to Call OpenMain() on the client screen or it won't show at all. On Windows calling OpenMain will freeze the program.
