I got it work, but not totally...

I first uninstall theide and upp and removed all files in the /home/user folder, changed the PPA to the nightly builds and then re-installed. I was then able to compile successfully the AddressBook.

I notice that I have now only GCC.bm.

Then, I re-installed my folders ~/upp, ~/MyApps and ~/.upp coming from my old Linux (and U++ 9732), keeping the new ~/.upp/theide folder and tried to compile one of my application, but I got again the same error about C++11. Trying with the AddressBook, I got also the error...

Obviously, something coming from my old install is bad, but what ? How could this affect the examples ?
